

GNSS Multipath and Spoofing rejection Using array antenna

June 20,2018

Kunihiko Hashimoto

FURUNO ELECTRIC CO., LTD.

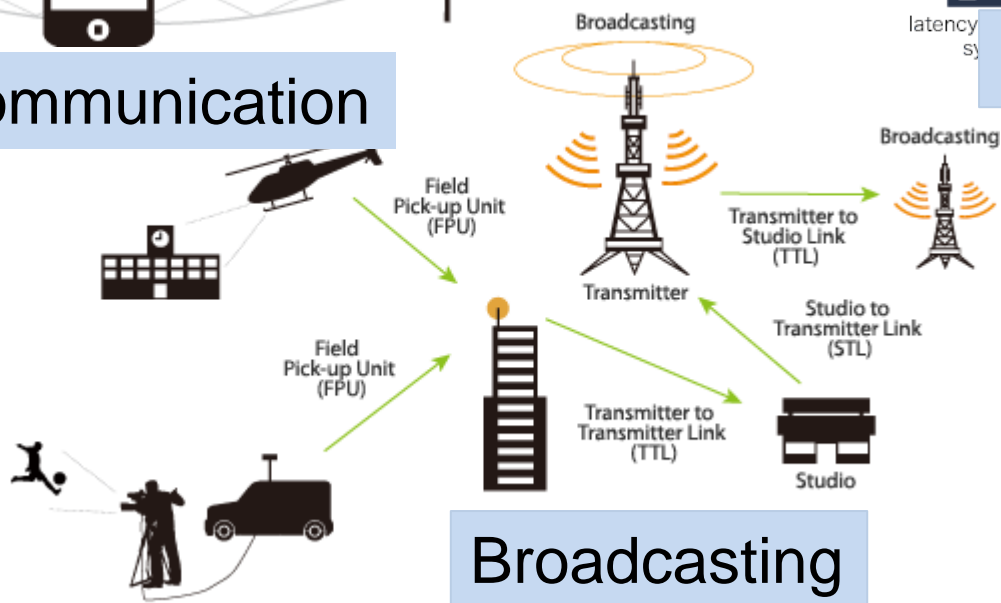

GNSS timing is used in various field

Telecommunication

Financial transaction

Broadcasting

⇒ It becomes more important

GNSS faces various threats

GNSS threats

Multipath

In case of using NLOS satellites, with the multipath, the timing error (TE) may reach several hundreds of nano seconds.

Spoofing

Spoofing causes serious incident. We've recently heard a lot in the news about GPS spoofing.

- Black Sea
October, 2017
- Eastern Mediterranean Sea
March, 2018

Jamming

Receiver can't work

GNSS system trouble

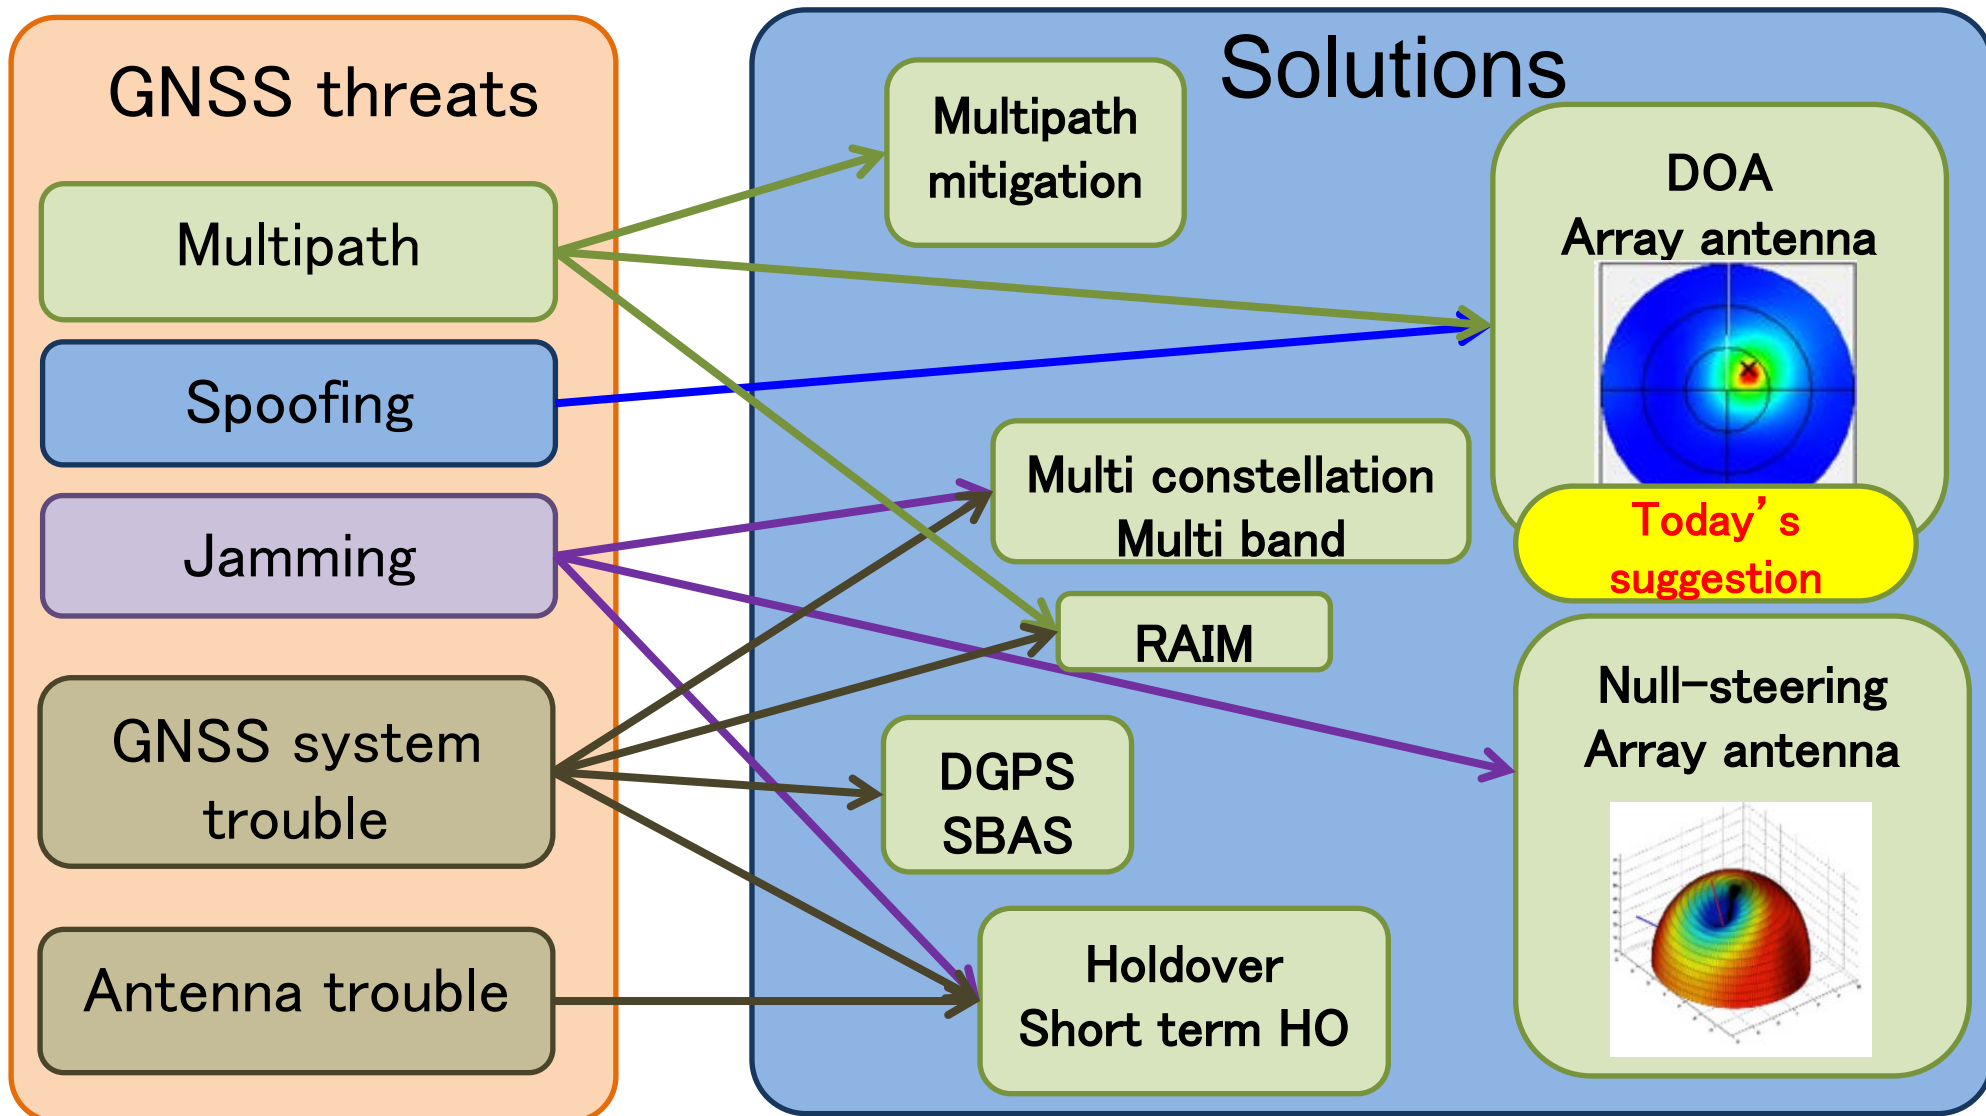

Some satellites of GPS sent out 13.7μsec faulty UTC correction parameters on January 26, 2016

Antenna trouble

Lightning strike

How should the threats be eliminated?

What's DOA(direction of arrive) Array antenna?

Carrier frequency
 $f = 1575.42\text{MHz}$ (GPS)

Satellit
 Vehicle

Ant 1 Carrier phase = Φ_1
 Ant 2 Carrier phase = Φ_2

$$\begin{cases} X = d \cdot \cos \alpha \\ X = \lambda \cdot (\Phi_1 - \Phi_2) / 2\pi \end{cases}$$

α can be calculated

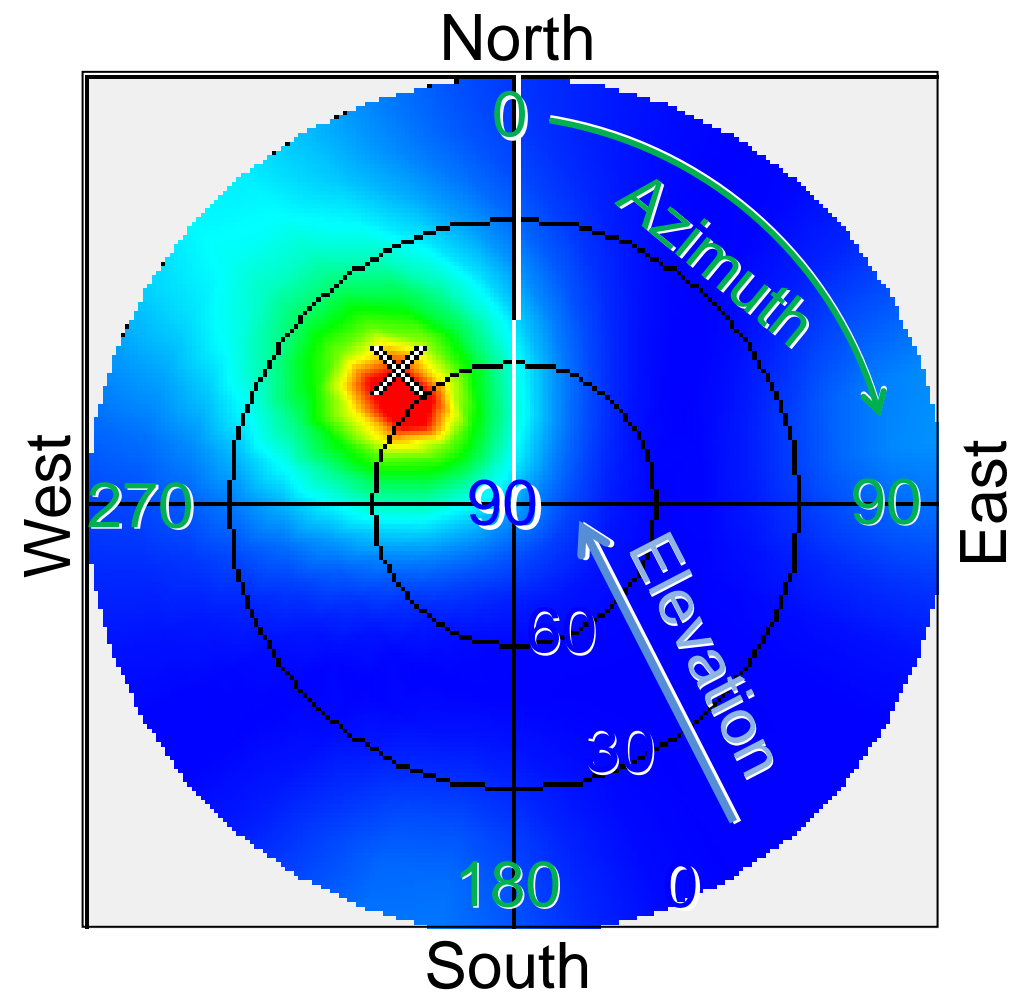

Indeed, we used "MUSIC" method.
 \Rightarrow DOA is calculated as angular spectrum

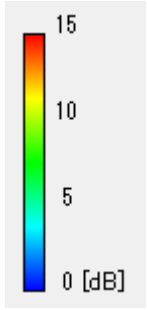

This is a skyplot of one Satellite
 The color scale is DOA spectrum.
 - Red is strong signal, Blue is weak
 X mark is Satellite Vehicle position

Skyplot of DOA spectrum and SV orbital position

CH16(25) C/N0=46, 47, 46, 45

PRN number

Symbol	description
X	Satellite Vehicle position (Calculated from Orbital information)
	DOA spectrum (Calculated from Array antenna)

How to calculate SV position from Orbital information

Each SV broadcast Orbital information
(Almanac data)

SV Orbital position

Diagram illustrating the mapping of satellite PRN numbers to elevation, azimuth, and SNR:

- 29: Satellite PRN number
- 38: Elevation[degrees]
- 05: Azimuth[degrees]
- 48: SNR[dB/Hz]

it indicates a position of each satellite from the receiver.

Prototype of DOA Array antenna

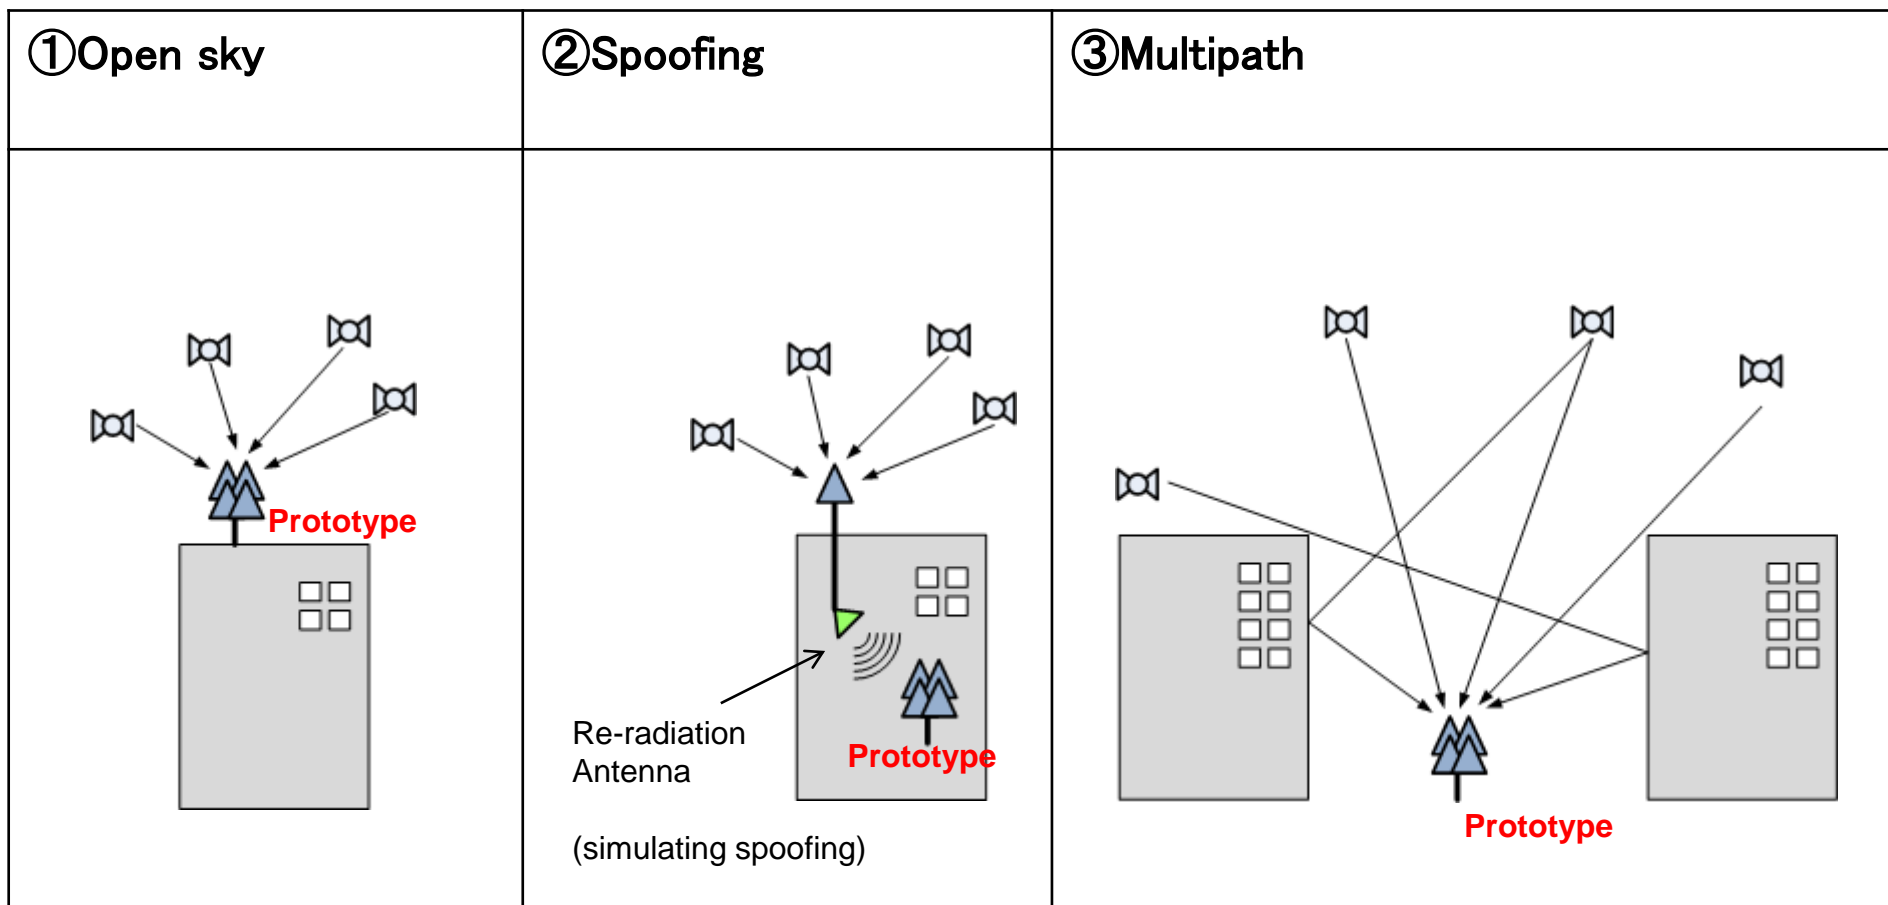

Prototype of DOA antenna is ...

- 2x2 array antenna
- 4 antenna elements and 4 GNSS Core
- Baseline length is 10cm

GNSS Navigation Data

Experiment

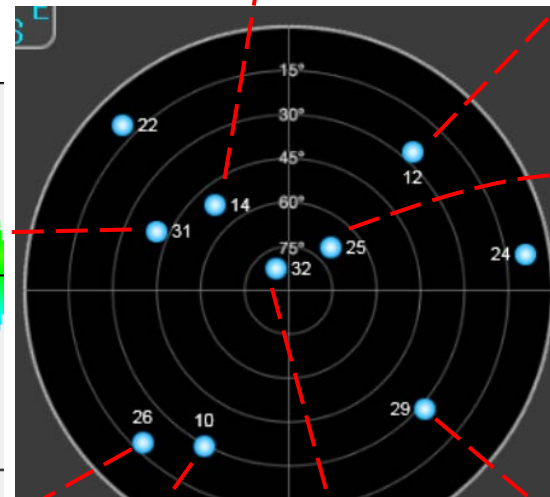

Result of Open sky

CH04(14), C/N0=46.46,46,43

CH03(12), C/N0=46.44,44,44

CH10(31), C/N0=49.48,48,47

CH07(25), C/N0=48.47,46,46

CH08(26), C/N0=42.44,44,37

CH02(10), C/N0=44.41,42,39

CH11(32), C/N0=50.50,50,49

CH09(29), C/N0=41.43,44,43

Prototype

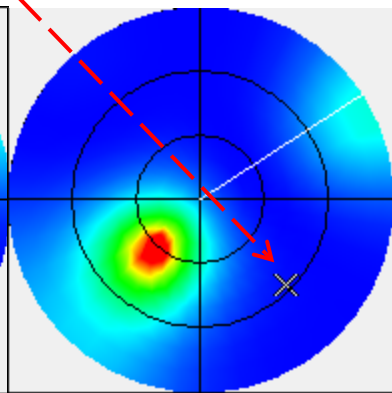

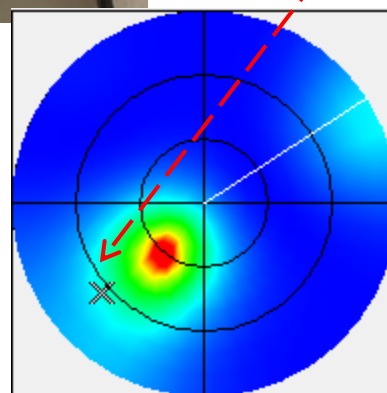

DOA spectrum and
SV Orbital position are
in good agreement.

Result of spoofing

Prototype

Re-radiation antenna
(spoofer is here!)

DOA spectrum of each satellite
shows the same direction.
(not SV Orbital position)

It indicates the location of the spoofer.

How to detect position of the spoofer?

The position of the spoofer can be detected by using two or more DOA array antennas.

Result of multipath

Test location : NTT R&D Center
(Musashino, Tokyo, Japan)

LOS satellite

PRN 16, 21,
26, 31

DOA spectrum and
SV Orbital position are in good
agreement.

NLOS satellite

PRN 8, 9, 14,
23, 27, 29

We couldn't calculate DOA spectrum

Except PRN 27. It seems to be diffracted.

Summary

- Under the GNSS vulnerability, we suggest DOA array antenna.
 - DOA antenna can detect spoofing.
 - DOA antenna is also useful for detection of Multipath signals.
→ Excluding Multipath can improve timing accuracy.
-
